

# Information Management

## Assignment 1

MAITREYI PILLAI

# 3 places/applications that access my data consistently.

- I get regular blood draws, dental appointments and annual women's health testing. My insurance and doctors office always has access to my information and I never need to carry any papers or documents other than my credit or debit card.
  - These days international students are recommended to have their legal papers on them at all times. My i-94 has details on my immigration, the day I entered the USA, from which port etc.
  - When i go to fill air in my tyres, they just run the barcode of my vehicle and get all the information about my car, previous visits etc.
-

# Domains

- FORENSICS: I am a fan of true crime and thrillers. I watched gamuts of content that talk about solving cold cases from the 60's, 70's, 90's that were only possible after the DNA testing technology was developed.
  - Function: is that it solves cases even if evidence was collected decades ago.
  - Interface: data received from victims is stored and then matched with new DNA that becomes part of the system.
  
  - EDUCATION: Applications that match teachers and students based on what is being taught, per hour budgets, time zones etc. I myself private tutored students during my undergrad through these applications years ago.
-

# Why no SQL in the 2000's?

Incorporating new types of data in traditional formats before the relational database. Example, social media.

SQL is a structured spreadsheet so it needs accuracy in data and consistency while NoSQL nests information- I think more of it as the toggle option.

---

# Types of Table for social media like Reddit

## Entity Table

I understood this as each individual is the unit of analysis.  
And that all of their actions are recorded within their row.

## Relationship Table/Join Table

I understood this as a dyadic relationship for instance in data related to economic sanctions or deals between two states.  
In social media that is the count of people that follow me and that I follow them back

## Interaction Table

This keeps data based on the likes or the activity between the dyads.
