

AI Surveillance Tech Trade Database Project

Maitreyi Pillai

PhD student, TA
EPPS, UTDallas

In the previous schema, based on the feedback, there was a lot of redundant information and relationships and connections between the attributes to their own entity (table name) and to other entities was not very clear.

Working on this feedback was the key progress that I made until now.

Now I have a:

- Clearer schema
- No duplicates or redundant information
- Reasoning behind what I consider primary or foreign keys
- Which is the main table of the database and why
- I also attempted to define relationships.

The key idea that is being examined:

Do AI tech transfers have an impact on human rights across countries?

Research Question:

Do AI transfers/adoptions affect human rights outcomes?

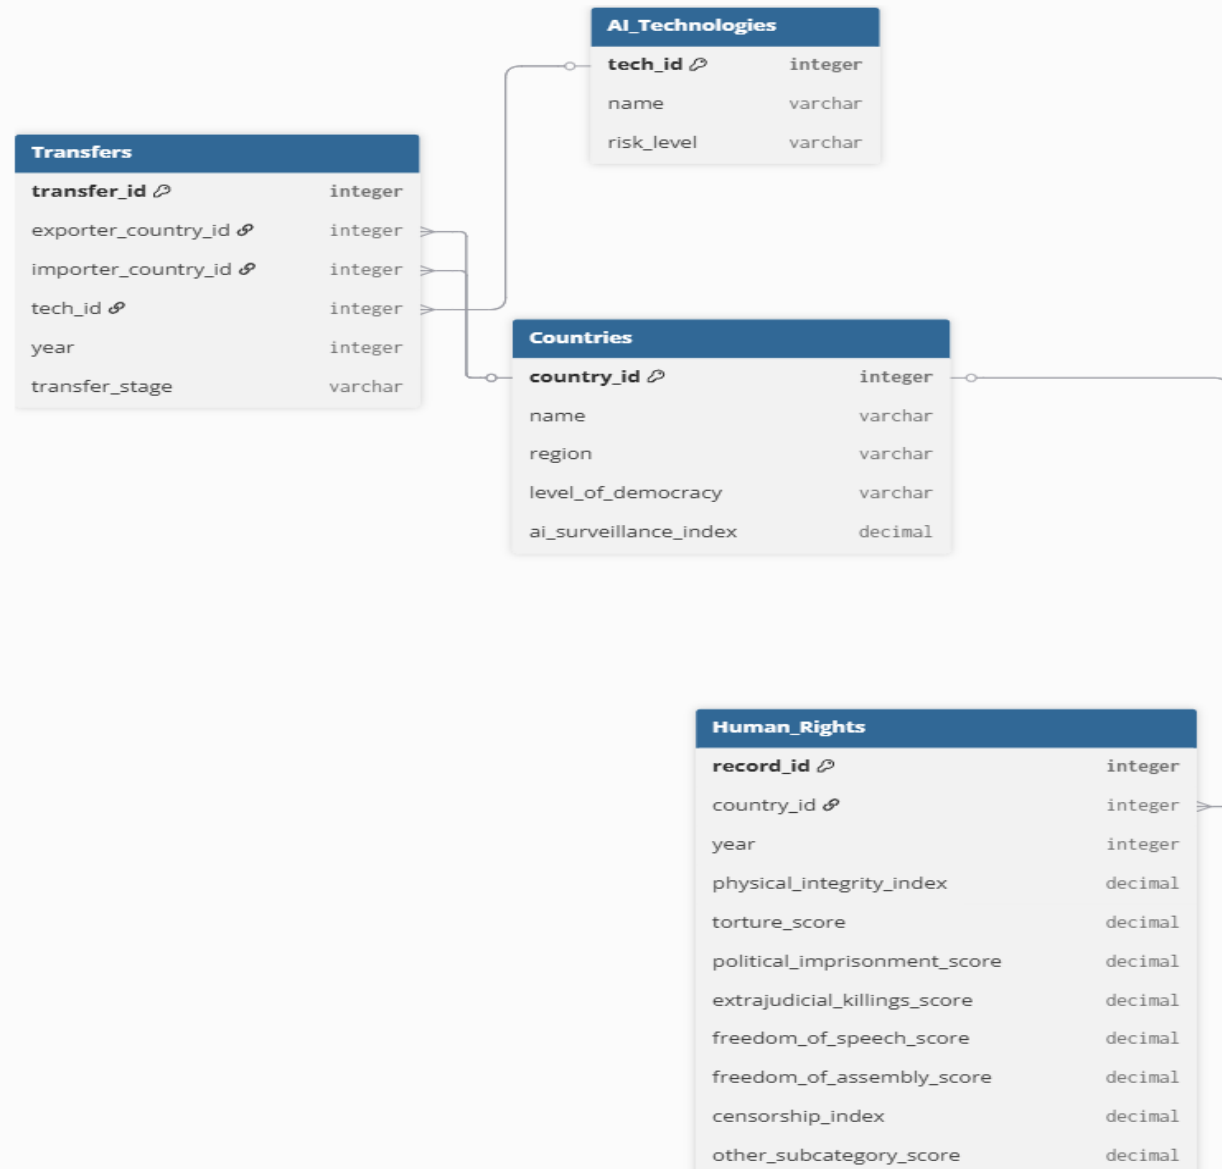

Entities: Countries; AI Technologies; Transfers; Human Rights

Relationships (defined):

- Transfers -> Countries (exporter country & importer country)
- Transfers -> AI Tech
- Human Rights -> Countries -> Transfers

Thus, making the Transfers table the main table of the database.

Schema

Countries Table

- Country id is the primary key – each country has a unique id, which connects to the transfers table and the human rights table.

- There is no foreign key in this table

AI Tech table

- Tech id is the primary key here – the idea is that each type of ai tech that is traded will have categories like facial recognition, or surveillance tool etc.

- No foreign key

Transfers Table

- Transfer id will be the primary key

Foreign Keys:

- Exporter country id will link to the country id in the country table

- Importer country id will link to the country id in the country table

- Tech id will link to the tech id that is in the AI Tech table

- This is the main table that makes sure all the tables are logically connected to each other.

Human Rights Table

- Record id is unique identifier for each human right abuse record

- Country id is the foreign key so that when evaluating in research we can see which country and their ai surveillance index and their level of democracy is that particular human rights score relevant to.
