

DB Project Progress Report II

Project Migration and Architecture Database summary

- I struggled the most with basic things of Postgre, I had downloaded the wrong version and there was some incompatibility, then I ended up realizing that I had installed the pgadmin4 but not the postgresql and I also forgot my superpassword once but now everything functions
- Once I fixed the metrics unit for all the attributes, I was able to generate a data
- I simulated the data for three tables in R (Transfers, Countries and Technologies)
- I got all the data for the tables to be transferred to my pg admin and it now has the three main tables.
- I synced my github and shinyapps
- I need to deploy the app now
